

# Database Programming with PL/SQL

3-2
Retrieving Data in PL/SQL

#### Objectives

This lesson covers the following objectives:

- Recognize the SQL statements that can be directly included in a PL/SQL executable block
- Construct and execute an INTO clause to hold the values returned by a single-row SQL SELECT statement
- Construct statements to retrieve data that follow good practice guidelines
- Construct statements that apply good practice guidelines for naming variables

#### Purpose

- In this lesson, you learn to embed standard SQL SELECT statements in PL/SQL blocks. You also learn the importance of following usage guidelines and naming convention guidelines when retrieving data.
- Blocks can be a good method for organizing your code. When you review code written by someone else, it is easier to read chunks of a program than it is to read one long continuous program.

#### SQL Statements in PL/SQL

- You can use the following kinds of SQL statements in PL/SQL:
- SELECT to retrieve data from the database.
- DML statements, such as INSERT, UPDATE, and DELETE to make changes to rows in the database.
- Transaction control statements, such as COMMIT, ROLLBACK, or SAVEPOINT. You use transaction control statements to make the changes to the database permanent or to discard them. Transaction control statements are covered later in the course.

# SQL Statements in PL/SQL Limit use of DDL and DCL

You cannot use DDL and DCL directly in PL/SQL.

Handle Style	Description
DDL	CREATE TABLE, ALTER TABLE, DROP TABLE
DCL	GRANT, REVOKE

 PL/SQL does not directly support data definition language (DDL) statements, such as CREATE TABLE, ALTER TABLE, or DROP TABLE and DCL statements such as GRANT and REVOKE.

## SQL Statements in PL/SQL Limit use of DDL and DCL

 You cannot directly execute DDL and DCL statements because they are constructed and executed at run time—that is, they are dynamic. Static SQL statements are statements that are fixed at the time a program is compiled.

#### SELECT Statements in PL/SQL Example

Retrieve data from the database with a SELECT statement.

### SELECT Statements in PL/SQL and the INTO Clause

• The INTO clause is mandatory and occurs between the SELECT and FROM clauses. It is used to specify the names of PL/SQL variables that hold the values that SQL returns from the SELECT clause. You must specify one variable for each item selected, and the order of the variables must correspond with the items selected.

#### Retrieving Data in PL/SQL Example

Retrieve hire\_date and salary for the specified employee.

```
DECLARE
 v_emp_hiredate
                   employees.hire_date%TYPE;
 v_emp_salary
                   employees.salary%TYPE;
BEGIN
             hire_date, salary
  SELECT
             v_emp_hiredate, v_emp_salary
    INTO
    FROM
             employees
             employee id = 100;
    WHERE
  DBMS_OUTPUT.PUT_LINE('Hiredate is: ' | v_emp_hiredate
                           ' and Salary is: '
                           v emp salary);
END;
```

### Retrieving Data in PL/SQL Embedded Rule

• SELECT statements within a PL/SQL block fall into the ANSI classification of embedded SQL for which the following rule applies: queries must return exactly one row. A query that returns more than one row or no rows generates an error.

```
DECLARE
  v_salary employees.salary%TYPE;

BEGIN
  SELECT salary INTO v_salary
   FROM employees;

DBMS_OUTPUT_LINE(' Salary is : ' || v_salary);

END;
```

ORA-01422: exact fetch returns more than requested number of rows

#### Retrieving Data in PL/SQL Example

 Return the sum of the salaries for all the employees in the specified department.

### Guidelines for Retrieving Data in PL/SQL

- The guidelines for retrieving data in PL/SQL are:
- Terminate each SQL statement with a semicolon (;).
- Every value retrieved must be stored in a variable using the INTO clause.
- The WHERE clause is optional and can contain input variables, constants, literals, or PL/SQL expressions. However, you should fetch only one row and the usage of the WHERE clause is therefore needed in nearly all cases.

### Guidelines for Retrieving Data in PL/SQL

- Specify the same number of variables in the INTO clause as database columns in the SELECT clause. Be sure that they correspond positionally and that their data types are compatible.
- Declare the receiving variables using %TYPE.

#### **Guidelines for Naming Conventions**

 In potentially ambiguous SQL statements, the names of database columns take precedence over the names of local variables.

```
DECLARE
  v_hire_date
                    employees.hire_date%TYPE;
  employee_id
                    employees.employee id%TYPE := 176;
BEGIN
                  hire date
  SELECT
                  v hire date
    INTO
                  employees
    FROM
                  employee_id = employee_id;
    WHERE
END;
ORA-01422: exact fetch returns more than requested number of rows
```

This example raises an unhandled runtime exception because in the WHERE clause, the PL/SQL variable name is the same as that of the database column name in the employees table.

# Guidelines for Naming Conventions Example

What is deleted in the following PL/SQL block?

```
DECLARE
  last_name VARCHAR2(25) := 'King';
BEGIN
  DELETE FROM emp_dup WHERE last_name = last_name;
END;
```

#### **Guidelines for Naming Conventions Details**

- Guidelines for naming conventions:
- Use a naming convention to avoid ambiguity in the WHERE clause.
- Avoid using database column names as identifiers.
- Errors can occur during execution because PL/SQL checks the database first for a column in the table.
- The names of local variables and formal parameters take precedence over the names of database tables (in a PL/SQL statement).
- The names of database table columns take precedence over the names of local variables.

#### Summary

In this lesson, you should have learned how to:

- Recognize the SQL statements that can be directly included in a PL/SQL executable block
- Construct and execute an INTO clause to hold the values returned by a single-row SQL SELECT statement
- Construct statements to retrieve data that follow good practice guidelines
- Construct statements that apply good practice guidelines for naming variables
